

## 10-1: Fundamentals of Subqueries

### Vocabulary

Correlated subquery	It accepts a value from the inner query to complete its SELECT statement
Subquery	An inner query that is nested within an outer query.
Pair-wise subquery	An inner query that compares multiple columns at the same time.
Single-row subquery	An inner query that returns only one row to the outer query.
Non-pair -wise subquery	An inner query that compares the multiple columns one at a time in different subqueries.
Multi row subquery	An inner query that returns one or more rows to the outer query
Nested query	Another name for a subquery.

### Try It / Solve It

1. What is the purpose of using a subquery?
  - a. To be used as a filter or condition to perform a second subquery.
2. What is a subquery?
  - a. A query nested in another query.
3. What DJs on Demand d\_play\_list\_items song\_id's have the same event\_id as song\_id 45?
  - a. `SELECT song_id FROM d_play_list_items WHERE event_id = (SELECT event_id FROM d_play_list_items WHERE song_id = 45);`
4. Which events in the DJs on Demand database cost more than event\_id = 100?
  - a. `SELECT event_id, cost FROM events WHERE cost > (SELECT cost FROM events WHERE event_id = 100);`
5. Find the track number of the song that has the same CD number as "Party Music for All Occasions."

- a. `SELECT track_number FROM d_songs  
WHERE cd_number = (SELECT cd_number FROM d_songs WHERE title =  
'Party Music for All Occasions');`
  6. List the DJs on Demand events whose theme code is the same as the code for "Tropical."
    - a. `SELECT event_id FROM d_events`
    - b. `WHERE theme_code = (SELECT theme_code FROM d_themes WHERE  
theme_name = 'Tropical');`
  7. What are the names of the Global Fast Foods staff members whose salaries are greater than the staff member whose ID is 12?
    - a. `SELECT name FROM gff_staff  
WHERE salary > (SELECT salary FROM gff_staff WHERE staff_id = 12);`
  8. What are the names of the Global Fast Foods staff members whose staff types are not the same as Bob Miller's?
    - a. `SELECT name FROM gff_staff  
WHERE staff_type <> (SELECT staff_type FROM gff_staff WHERE name = 'Bob  
Miller');`
  9. Which Oracle employees have the same department ID as the IT department?
    - a. `SELECT employee_id, name FROM employees  
WHERE department_id = (SELECT department_id FROM departments WHERE  
department_name = 'IT');`
  10. What are the department names of the Oracle departments that have the same location ID as Seattle?
    - a. `SELECT department_name FROM departments  
WHERE location_id = (SELECT location_id FROM locations WHERE city =  
'Seattle');`
  11. Indicate whether the statement regarding subqueries is True or False.
    - a. It is good programming practice to place a subquery on the right side of the comparison operator. True
    - b. A subquery can reference a table that is not included in the outer query's FROM clause. False
    - c. Single-row subqueries can return multiple values to the outer query. False
- 

## Database Programming with SQL 10-2: Single-Row Subqueries

### Try It / Solve It

1. Write a query to return all those employees who have a salary greater than that of Lorentz and are in the same department as Abel.
 `SELECT * FROM employees  
WHERE salary > (SELECT salary FROM employees WHERE name = 'Lorentz')  
AND department_id = (SELECT department_id FROM employees WHERE name = 'Abel');`

2. Write a query to return all those employees who have the same job id as Rajs and were hired after Davies.
  - a. `SELECT * FROM employees  
WHERE job_id = (SELECT job_id FROM employees WHERE name = 'Rajs')`
  - b. `AND hire_date > (SELECT hire_date FROM employees WHERE name = 'Davies');`
3. What DJs on Demand events have the same theme code as event ID = 100?
  - a. `SELECT event_id FROM d_events  
WHERE theme_code = (SELECT theme_code FROM d_events WHERE  
event_id = 100);`
4. What is the staff type for those Global Fast Foods jobs that have a salary less than those of any Cook staff-type jobs?
  - a. `SELECT staff_type FROM gff_jobs`
  - b. `WHERE salary < ANY (SELECT salary FROM gff_jobs WHERE staff_type = 'Cook');`
5. Write a query to return a list of department id's and average salaries where the department's average salary is greater than Ernst's salary.
  - a. `SELECT department_id, AVG(salary) FROM employees  
GROUP BY department_id  
HAVING AVG(salary) > (SELECT salary FROM employees WHERE name = 'Ernst');`
6. Return the department ID and minimum salary of all employees, grouped by department ID, having a minimum salary greater than the minimum salary of those employees whose department ID is not equal to 50.
  - a. `SELECT department_id, MIN(salary) FROM employees  
GROUP BY department_id  
HAVING MIN(salary) > (SELECT MIN(salary) FROM employees WHERE  
department_id <>`

### 10-3: Multiple-Row Subqueries

#### Try It / Solve It

1. What will be returned by a query if it has a subquery that returns a null ?
  - a. If a subquery returns null, the main query may produce unexpected results or no results, depending on the logic of the outer query.
2. Write a query that returns jazz and pop songs. Write a multi-row subquery and use the d\_songs and d\_types tables. Include the id, title, duration, and the artist name.
  - a. `SELECT id, title, duration, artist_name FROM d_songs  
WHERE type_id IN (SELECT type_id FROM d_types WHERE type_name IN ('Jazz', 'Pop'));`
3. Find the last names of all employees whose salaries are the same as the minimum salary for any department.

- a. `SELECT last_name FROM employees  
WHERE salary = (SELECT MIN(salary) FROM employees GROUP BY  
department_id);`
4. Which Global Fast Foods employee earns the lowest salary? Hint: You can use either a single-row or a multiple-row subquery.
  - a. `SELECT name FROM gff_employees  
WHERE salary = (SELECT MIN(salary) FROM gff_employees);`
5. Place the correct multiple-row comparison operators in the outer query WHERE clause of each of the following:
  - a. Which CDs in our d\_cds collection were produced before “Carpe Diem” was produced? `WHERE year < (SELECT year ...`
  - b. Which employees have salaries lower than any one of the programmers in the IT department? `WHERE salary <(SELECT salary ...`
  - c. What CD titles were produced in the same year as “Party Music for All Occasions” or “Carpe Diem”?
  - d. `WHERE year ____IN____(SELECT year ...`
  - e. What song title has a duration longer than every type code 77 title?
  - f. `WHERE duration ____> ALL____(SELECT duration ...`
6. If each WHERE clause is from the outer query, which of the following are true?
  - a. `WHERE size > ANY` -- If the inner query returns sizes ranging from 8 to 12, the value 9 could be returned in the outer query.
    - i. T
  - b. `WHERE book_number IN` -- If the inner query returns books numbered 102, 105, 437, and 225 then 325 could be returned in the outer query.
    - i. F
  - c. `WHERE score <= ALL` -- If the inner query returns the scores 89, 98, 65, and 72, then 82 could be returned in the outer query.
    - i. T
  - d. `WHERE color NOT IN` -- If the inner query returns red, green, blue, black, and then the outer query could return white.
    - i. T
  - e. `WHERE game_date = ANY` -- If the inner query returns 05-Jun-1997, 10-Dec-2002, and 2-Jan-2004, then the outer query could return 10-Sep-2002.
    - i. F
7. The goal of the following query is to display the minimum salary for each department whose minimum salary is less than the lowest salary of the employees in department 50. However, the subquery does not execute because it has five errors. Find them, correct them, and run the query.
  - a. `SELECT department_id FROM employees  
WHERE MIN(salary) HAVING MIN(salary) > GROUP BY department_id SELECT  
MIN(salary) WHERE department_id < 50;`
  - b. `SELECT department_id  
FROM employees  
GROUP BY department_id`

HAVING MIN(salary) > (SELECT MIN(salary) FROM employees WHERE department\_id < 50);

8. Which statements are true about the subquery below?
  - a. SELECT employee\_id, last\_name FROM employees  
WHERE salary =  
(SELECT MIN(salary)  
FROM employees  
GROUP BY department\_id);
    - i. The inner query could be eliminated simply by changing the WHERE clause to WHERE MIN(salary).
      1. F
    - ii. The query wants the names of employees who make the same salary as the smallest salary in any department.
      1. T
    - iii. The query first selects the employee ID and last name, and then compares that to the salaries in every department.
      1. T
    - iv. This query will not execute.
      1. F
9. Write a pair-wise subquery listing the last\_name, first\_name, department\_id, and manager\_id for all employees that have the same department\_id and manager\_id as employee 141. Exclude employee 141 from the result set.
  - a. SELECT last\_name, first\_name, department\_id, manager\_id  
FROM employees  
WHERE (department\_id, manager\_id) = (SELECT department\_id, manager\_id  
FROM employees WHERE employee\_id = 141) AND employee\_id <> 141;
10. Write a non-pair-wise subquery listing the last\_name, first\_name, department\_id, and manager\_id for all employees that have the same department\_id and manager\_id as employee 141.
  - a. SELECT last\_name, first\_name, department\_id, manager\_id  
FROM employees  
WHERE department\_id = (SELECT department\_id FROM employees WHERE employee\_id = 141) AND manager\_id = (SELECT manager\_id FROM employees WHERE employee\_id = 141) AND employee\_id <> 141;

#### 10-4: Correlated Subqueries

##### Try It / Solve It

1. Explain the main difference between correlated and non-correlated subqueries?
2. Correlated subquery depends on data from the outer query, executing once for each row processed by the outer query. Non-correlated subquery is independent of the outer query and can be executed on its own.

3. Write a query that lists the highest earners for each department. Include the last\_name, department\_id, and the salary for each employee.
  - a. 

```
SELECT last_name, department_id, salary
FROM employees e1
WHERE salary = (SELECT MAX(salary)
FROM employees e2
WHERE e1.department_id = e2.department_id) ORDER BY department_id;
```
4. Examine the following select statement and finish it so that it will return the last\_name, department\_id, and salary of employees who have at least one person reporting to them. So we are effectively looking for managers only. In the partially written SELECT statement, the WHERE clause will work as it is. It is simply testing for the existence of a row in the subquery.
  - a. 

```
SELECT (enter columns here)
FROM (enter table name here) outer
WHERE 'x' IN (SELECT 'x'
FROM (enter table name here) inner
WHERE inner(enter column name here) = inner(enter column name here))
```
5. Finish off the statement by sorting the rows on the department\_id column.
  - a. 

```
SELECT last_name, department_id, salary FROM employees outer
WHERE 'x' IN (SELECT 'x'
```
  - b. 

```
FROM employees inner
```
  - c. 

```
WHERE inner.manager_id = outer.employee_id) ORDER BY department_id;
```
6. Using a WITH clause, write a SELECT statement to list the job\_title of those jobs whose maximum salary is more than half the maximum salary of the entire company. Name your subquery MAX\_CALC\_SAL. Name the columns in the result JOB\_TITLE and JOB\_TOTAL, and sort the result on JOB\_TOTAL in descending order. Hint: Examine the jobs table. You will need to join JOBS and EMPLOYEES to display the Job\_title.
  - a. 

```
WITH MAX_CALC_SAL AS (
SELECT job_id, MAX(salary) AS job_total FROM employees
GROUP BY job_id)
```
  - b. 

```
SELECT j.job_title AS JOB_TITLE, mcs.job_total AS JOB_TOTAL FROM
MAX_CALC_SAL mcs
JOIN jobs j ON mcs.job_id = j.job_id
WHERE mcs.job_total > (SELECT MAX(salary) / 2 FROM employees) ORDER
BY JOB_TOTAL DESC;
```
